Summary

Results-driven Computer Science student with a bias for action. I ship working software. Whether it's building high-performance backends, deploying ML models, or automating workflows—I get it done. I leverage AI coding assistants (GitHub Copilot, ChatGPT) as a force multiplier, cutting boilerplate time and accelerating feature delivery without compromising quality. I thrive in fast-paced, outcome-oriented environments where owning problems end-to-end and delivering measurable business impact is what matters.

Technical Skills

Languages: Java, SQL, C++, Python, JavaScript

Backend & Microservices: Spring Boot, Spring Security, WebSocket (STOMP), REST APIs, JWT Auth

Frontend: React.js, Streamlit, HTML, CSS

Databases (RDBMS & NoSQL): PostgreSQL, MySQL, MongoDB

AI/ML & Automation: TensorFlow, Scikit-learn, LangChain (basics), Prompt Engineering

DevOps & Cloud: Docker, AWS (EC2, S3, IAM), CI/CD (GitHub Actions)

Development Accelerators: GitHub Copilot, ChatGPT, Cursor IDE

Core: DSA, OOP, DBMS, System Design

Tools: Git, Maven, Postman, Swagger, JUnit, PyTest

Education

VIT Bhopal University
B.Tech in CSE — CGPA: 7.95/10.00

Bhopal, India
2023–2027

Project Experience (Delivered End-to-End)

Realtime Collaborative Spreadsheet Backend

GitHub

Java, Spring Boot, WebSocket, JWT, PostgreSQL

- Delivered a production-ready real-time collaboration engine supporting 100+ concurrent users with live cell updates, presence tracking, and instant sync.
- Leveraged ChatGPT to rapidly prototype WebSocket event-driven logic and debug edge-cases (malformed frames), cutting development time by 30%.
- Killed manual setup friction: Dockerized the entire stack; onboarded 5+ developers in under 2 minutes (down from 45 minutes) via a single command.
- Zero-tolerance for broken code: Automated the CI/CD pipeline with GitHub Actions ensuring 100% test pass rates on every push, catching critical logical errors before merge.
- Optimized PostgreSQL query execution by tuning indexes and connection pooling, achieving sub-50ms response times for heavy concurrent sheet operations.

AI-Based Skin Disease Detection System

GitHub

Python, FastAPI, TensorFlow, MobileNetV2, React.js

- Deployed a working diagnostic tool with **85% validation accuracy**, enabling users to upload images and receive instant predictions via a polished React UI.
- Used FastAPI to build high-performance inference APIs, reducing latency to **~200ms per request**.
- Automated error handling using PyTest + mock data to validate model behavior against malformed inputs, ensuring zero crashes in production.
- Ship-ready deployment: Containerized with Docker and deployed on AWS EC2 with a fully automated CI pipeline.

Gridlock – AI-Powered Traffic Incident Management

GitHub

Python, Streamlit, CatBoost, Pandas, Folium

- Developed a predictive priority engine (Critical/Medium/Low) to help emergency services allocate resources faster—achieved measurable accuracy with CatBoost.
- Transformed raw spatio-temporal data into a functional dashboard with real-time Folium maps, providing instant visual impact assessments.
- Built a smart recommendation system that suggests optimal resource deployment (officers, barricades, ambulances) based on severity, eliminating manual guesswork.
- Debugged model performance by analyzing feature importance; identified and corrected 3 hidden data imbalances that improved prediction reliability.

Achievements

Winner – Zoho Hackathon 2025 (IoT): Built and delivered *SenseOps*, a fully functioning AI-powered IoT automation platform—automated device health monitoring and workflow triggers, winning the top prize.
